NHS Health Check Information

NHS Health Check

The NHS Health Check programme is a universal and systematic programme for everyone between the ages of 40 74 that will assess people's risk of heart disease, stroke, kidney disease and diabetes and will support people to reduce or manage that risk through individually tailored advice.

The check itself will involve a number of straight forward tests and measurements covering height, weight, family history, smoking and blood pressure and will include a simple blood test for cholesterol and (in some cases) glucose levels. Each person's risk of having a heart attack or stroke, or developing diabetes or kidney disease will be communicated to the individual in a way that they understand.

This will be followed up with individually tailored advice suitable for that person on how to manage or lower that risk. For those at low risk, this might be no more than general advice on how to stay healthy. Others at moderate risk may be signposted or referred to a weight management programme, stop smoking service, or a brief intervention to increase levels of physical activity. Those at high risk might require medication with statins or blood pressure treatment, or an intensive lifestyle management programme for those identified with impaired glucose regulation. A few may need further assessment or tests.

We also expect to identify people who already have a vascular disease where it has so far gone undetected, particularly type 2 diabetes and chronic kidney disease. In such cases, patients will benefit from early identification and disease management that will improve their health outcomes and help prevent adverse complications. These people will be removed from the ongoing call and recall programme and managed through existing care pathways.

Full user guidance can be found on the NHS Information Centre website:
